

ROYLAN DEXTER B. CAMU

Dasmariñas City, Cavite | roylan.camu@gmail.com | [LinkedIn](#) | [GitHub](#) | Personal Website/Portfolio

SUMMARY

Computer Engineering student (BS, University of the Philippines Diliman, expected 2026) with hands-on experience in SQL, Python, and Power BI. Built a production Flask/SQLite system automating pricing, billing, and inventory analytics for a multi-clinic optical lab, and an embedded systems project processing real-time multi-sensor telemetry. Strong foundation in ETL workflows, data validation, and dashboard reporting; seeking a Data/BI Analyst role to apply analytical and technical skills to data-driven decision-making.

EDUCATION

University of the Philippines – Diliman , Diliman, Quezon City	2026
• <i>BS in Computer Engineering</i>	
Emilio Aguinaldo College – Cavite , Dasmariñas City, Cavite	2020

TECHNICAL SKILLS

- *Computer Languages*: Python, SQL, HTML, CSS, C++
- *Tools*: Git, Power BI, Excel
- *Skills*: Programming, Software Development, Embedded Systems, ETL

PROJECTS

OptiFlow – Optical Laboratory Management System, Independent Project	2025
• Designed and built a full-stack Flask/SQLite system automating job intake, dynamic pricing, billing, and dispatch for a multi-clinic optical lab, replacing manual spreadsheet tracking. • Built a dynamic pricing engine evaluating 90+ lens SKUs against prescription ranges, coatings, and service tiers to auto-calculate accurate job costs in real time. • Developed an inventory analytics module tracking stock levels, reorder thresholds, and cost per unit, with automated Excel exports (jobs, invoices, revenue-by-clinic) for reporting. • Wrote 100+ automated tests validating pricing logic and data consistency across CSV-driven configuration.	
Can-Sat: GPS Wind Estimation & Smoke Detection, Undergraduate Project (UP EEEl)	June 2025
• Co-developed an embedded CanSat using a PIC32 microcontroller, GPS module, and air-quality sensors (SEN54, SGP30) to detect smoke and estimate wind speed/direction during descent. • Built real-time data logging and a live web dashboard streaming sensor telemetry (PM1, PM2.5, eCO2, altitude) during flight tests. • Implemented threshold-based smoke detection logic ($PM_{2.5} \geq 100 \mu g/m^3$, $eCO_2 \geq 2000 \text{ ppm}$) validated against clean-air baseline readings. • Delivered the project across a 16-week timeline with adviser sign-off, documented in a full technical report.
